Hippocampal replay recapitulates wake experiences

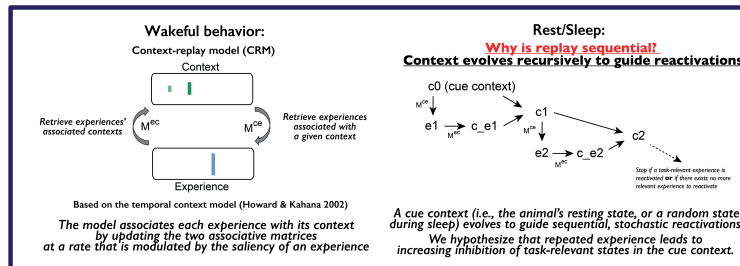

What is the nature of hippocampal replay?

The reinforcement learning (RL) perspective: Replay as prioritized value updates

Our proposal: Replay as context-driven memory reactivation

The directionality of replay is context-dependent

Increase in forward replay during sleep

Replay over-represents rewarding experiences

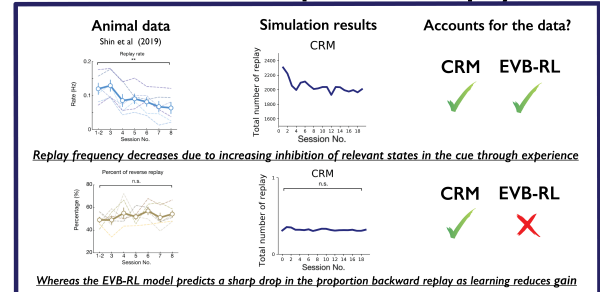

Reward uniquely modulates reverse replay

Replay of remote & novel shortcut trajectories

The influence of experience on replay

Conclusions

We propose that, during wakefulness, animals associate experiences with the contexts in which they are encoded, in a manner modulated by the salience of each experience. During periods of quiescence, replay emerges when contextual cues trigger a cascade of reactivations driven by the reinstatement of each memory's encoding context, which in turn facilitates memory consolidation.

Our theory unifies numerous replay phenomena, including findings that reinforcement learning models fail to account for.
